Cards with coating varnish

Instructions No. 1749

Difficulty: Beginner

Working time: 1 hour

Glaze resin is ideal for giving profile and gloss to flat surfaces. Why not give your cards a new shine layer? **Glass'100 epoxy coating resin** remains **flexible** after drying, making it perfect for scrapbooking Card design, projects and many other ideas.

It's that simple to design the cards:

First you design your cards according to your wishes. How about for example the popular ?

To do this, **choose** a motif **oNapkinsr** straw silk motif and cut it out. First spread your card with **Napkin varnish** and then place the straw silk motif in the desired position. Now coat the motif again with Napkin varnish. Let everything dry well

Another nice design option is the handlettering**.** For this, you can add the desired slogan to your card using the handlettering technique. After drying, weigh down overnight, as the card will curl slightly due to moisture

Now place the card on a silicone base. The Résin**'Pad** is best suited for this, as it has nubs so that the resin can run off and the underside of the card does not stick.

Then mix the epoxy coating resin **Flex according to the** package instructions and pour over the card. Allow the card to dry for approx. 24 hours.
